

Throughout the history, humanity and other species have shared this planet. Before the centuries, people and other species have had separate habitat to stay alive despite hunting. However, after the increasing of population, people occupied animals habitats such as forests. Unfortunately, the damage to animals was not limited with stealing their life zone. Even though the extinction of species may be observed as a life conditions among these species, the majority of the extinction or endangered species cases triggered by human faults. Nevertheless, some claimed that people ought to ignore reasons of species situation despite the global warming, including water scarcity, afforestation and air pollution.

On the one hand, many species are influenced by inadequate water resources and water pollution. Since many people do not prefer to consume eco-friendly products, the effect of global warming has started to increase it, leading to acid rains. The process start with harmful gasses which mix with clean water. After that, the dirty water comes to surface and polluting other clean water resources, causing several illnesses. Moreover, the temperature of the world is increased due to global warming. If the world temperature maintains the increase, the results will not only disaster for animals or plants, but

also humanity cannot survive in the world. Therefore, as Pyron (2013) points out, "Yes, we have altered the environment and, in doing so, hurt other species". As the Pyron explains, since people have adverse influence on species' life, they should be prioritized to conserve their life by adapting strict laws to solve water pollution and desertification.

On top of that, deforestation and air pollution are the other major reasons, causing to extinction. Since the population has rapidly increased, people aimed to extend accommodation opportunities. Therefore, the demand reached the peak point for construction business. However, the appropriate zone was limited for construct new structures, triggering to deforestation. Even though many insects, wild animals and plants were living in the forests, the trees are cutted by cruel people. After the disappear of the species habitats, people and species have shared common life zones, increasing the hunting and the natural process of evolution is shifted by humanity. Although some people could not understand the aware of the danger, the writer explained that "the loss of pollinators could result in a decrease in seed and fruit production, leading ultimately to the extinction of many important plants" (Cho, 2019, p.3). As the writer explains, extinction

of species has adverse effect on humans' lives. Thus, people not only give priority to protection of endangered species for saving the species' life but also it could damage to farming so human life.

On the other hand, the claim is that even if people find a solution to mitigate effect of global warming or other problems, the extinction will not be vanish it. The argument of this claim is that extinction is a component of nature life, almost every specie is a predator of other species. Therefore, people do not have to focus on extinction as hunting, playing a vital role in a sustainability of nature life causing extinction. Even if the argument could count acceptable, people's effect on rate of extinction is not subtle. For instance, type of insects disappear due to humans, causing to reduce predator of insects and the influence is maintaining by increasing. Thus, even though people cannot calculate the result of extinction in their subconscious, the awareness should be generated by policymakers or institutions. Overall, the endangered species' conservation play a vital role in working the system of world. People should handle this subject in order to living comply with species.

In conclusion, the idea of giving priority to protection of endangered species should be outweigh the opponent idea. People ~~do~~ should not only stop the extinction of species but also contribute to their life by seeking a solution. This planet does not belong to only humans despite the evolving. Thus, the stealing of the life rights is prevented by using eco-friendly products such as purchasing the car which is working without fuel. Many precautions can be taken by people to protect species.
