

The Importance Of Protect Endangered Species.

There is an important topic that scientists discuss about: we should save the endangered animals or we don't need to save endangered animals. Protecting endangered animals essential for environment because our habitat has an excellent source of order. If people don't pay attention to endangered animals the world's life order will be change. People are the reason of why species endangered. We are polluting our environment without thinking other species. People can change endangered species destiny if they want to change. There are numerous ways to save animals and develop our habitat.

There is an excellent order between animals, nature and humans. If one of them will destroy whole order will be finish. This essay argues the topics that why endangered species matter, why we need to protect them and lastly how we protect them.

Animals are crucial for human life. Humans and animals are compatible for each other. Our world changing day by day as a result of that there are some drawbacks for animals and our environment. "Today, the rate of extinction is occurring 1,000 to 10,000 times faster because of human activity" (Cho, 2019, P.1). Human activities are the reason why extinction occurs faster. Cho said "The main modern causes of extinction are the loss and degradation of habitat (mainly deforestation), over exploitation like fishing and hunting, climate change, invasive species and Nitrogen Pollution. (2019)"

Humans harm both nature and animals, when we do deforestation, pollute both air and nature. We start to accelerate the extinction of species. Also predators over exploit the animals with hunting and fishing. The reasons are clear. Governments should make laws about overhunting the animals. If this situation won't change our habitat will be destroyed. To illustrate bees are essential species for human life. They have a lot of contributions to the ecosystem.

"Bees, another valuable contributor to the ecosystem, - pollinate over 250,000 species of plants, including most of the 87 crops that humans rely on for food, such as almonds, apples and cucumbers." (Cho, 2019, P.2). If bees extinct we will be disaster. That is why endangered species matter.

Another reason for extinction is environmental change. Cho said "A new study found that extreme environmental change may trigger an 'extinction domino effect.'" (2019). If we lose one species this affects the whole ecosystem and everything around it and it is challenging to adapt new ecosystem because humans and other species get used to this ecosystem. Extinction, have an crucial role in our lives.

All species could change the system. "Even if it's not a keystone species, its loss will weaken the functionality of the entire ecosystem, which just makes it easier for that ecosystem to stop working." (Cho, 2019, P.1). For example if we kill cats whole environment will change because cats feed with

mouses and when we kill all cats, mouse number will increase and mouses started to be variable, they will be everywhere in our cities and houses. That is the same situation with extinction of species. That is why protecting of species is essential.

Some people argue that we do not need to save endangered species. They say that extinction is part of evolution. Pymon said that "extinction is the part of evolution, the mechanism by which natural selection removes the poorly adapted and allows the hardiest to flourish." (November 22, 2017). This point of view is not well considered because big part of the extinction of species reason is humans and their lifestyle. Humans have many mistakes like they pollute the environment, - destroy the forest and harm to animals. As a result of that they change the ecosystem. Governments change the attitude for environment with making laws and regulations. This will be change the species destiny in a good way and this provides long-term benefits for human nature. Our ecosystem has an perfect order. People need to protect this perfect order to be aware of the importance of endangered species in our lives.

Consequently, when we considered the drawbacks of extinction of species, we can say that endangered species are matter. Even one species is matter proof the importance of endangering species in human live.

People can change the world in a perfect way with new regulations. And laws making new regulations will affect environment positively. Endangered species deserves to protect by humans. They are extinct because of human behaviours. They are crucial for this perfect natural order. Humans should prioritize protect the environment, ecosystem, animals and endangered species. If one of them will destroy and disappear the whole system will be change in an bad way. But if the scenario change in a good way then the long-term benefits of protecting endangered animals will be much more. To sum up, saving these animals from extinction is crucial. Thus, endangered species are matter for humans.
