

Species have been on extinction for many days, many years and many centuries. Until today, there have been a lots of animals, plants and environmental place was a part of the extinction. Because of the human needs, worldwide diseases, outgrowing population and the massive pollution; species on the earth started to extinct. But the extinction is a part of the evolution. The extinction is a part of the wheel that the earth has to experience. We need to save ourselves before the species. Endangered species should not be prioritized because humans have to prioritize their needs first, they can't depend on endangered animals - unnecessary species for their futures and humans should create an environment to suit their survival needs.

Humans have to take care of their needs and create a stable future for human beings. Water supplies, foods, healthy environments are the basic needs that all the people around the earth has to access. But for many years, most of the people can not take care of their basic needs. "Will we be able to feed ourselves? Will our water supplies dry up?" (Pyron, 1) are the most daily questions humans are

asking. While the humans can not be enough for themselves, it's hard for them to prioritize endangered species. Humans do not pollute environment for their fun. Clothing need, food need is a priority. Because of the outgrowing population, world need more food, more clothes, more water and more space to live. Production is for every human being to access basic things. This is a cycle that has to happen. Pylon notes that extinction is the engine of evolution (1). Humans have to prioritize their basic needs than prioritize endangered species and sometimes the species have to extinct that all the people around the world can have their basic needs.

When humans can not even take care of their basic needs, they can not trust endangered species for their future. A lots of species, lots of kinds of species had extinct through many years. "The inevitability of death is the only constant in life, and 99.9 percent of all species that have ever lived, as many as 50 billion, have already gone extinct" (Pylon, 2). World do not need every kind of species. Not all of the species are necessary. And sometimes extinct is beneficial for the unbeneficial species to extinct. Even there

useful species in the world, world is not capable of taking care of it in 21st century. When the world is not capable of taking care of every human in the world, it is not capable of taking care of every species as well. An asteroid killed the dinosaurs a few million years ago. Even humans do not know too many facts about them, humans do not need dinosaurs for our environment. As Pylon notes "we don't depend on polar bears for our survival" (2). Humans only need basic needs. Humans do not need endangered animals and unnecessary species that have gone extinct which is a natural process of evolution.

Humans should create an environment to suit their survival needs. Since many years because of the growth for industrial products and technology the weather and the environment got too much pollution. Even the humans thought that they can depend their futures on technology, technology have not found a survival way for the earth. This caused more water to be used in technology. Like chatgpt using two cups of water to answer every question. People used technology and environment to make their life easy but this caused bigger problems.

Big development of the industry and technology started to use the basic needs of the population. So while trying to find a way to consume the basic needs correctly, humans accidentally caused a bigger problem. The industry pollution started to cause weather pollution. This weather pollution made the humans try to find a place which was cleaner weather and can produce basic needs. People started to move from big cities to small towns. Because people started to realize that they have to build their own safe environment for their future, and their kids. Humans did all of this to make their life better. Pyron mentions that Humans should feel less shame about molding their environment to suit their survival needs (2). People in the world started to notice the importance of every part of environment. Even endangered species shouldn't be prioritized to prioritize human needs first, every part of the environment should be prioritized. "We should save whatever species and habitats can be easily rescued, refrain from polluting waterways, limit consumption of fossil fuels and rely more on low-impact renewable-energy sources" (Pyron, 2). So, humans should be creating an environment for their basic needs and create a stable, equitable future and understanding extinction is a natural

process of evolution while not purposely harming them.

Extinction is the part of our lives. Lots of species have died in millions of years and still is. Every evolution and every investment caused a change in world and keeps changing. These are a natural selection that world repeats itself. People in the world has to keep prioritizing themselves but they should keep that while prioritizing moderation. Humans should not prioritize extinction to prioritize their needs, depend on things that can save their future and create an environment to suit their survival needs.
