

It is known that extinction of some species has become a crucial problem in our changing world. Also, this problem and its inevitable results has been increasing day by day. The main reason that triggered this problem is said to be human activities and their impacts on ecosystem. While some people argue that extinction should be accepted as a natural process of evolution, other thinks conservation of endangered species should be prioritized. This essay will discuss that endangered species should be prioritized in order to conserve the natural balance of our world and prevent the possible adverse impacts of endangered species on economics.

Every species which lives in our world are extremely important to conserve the natural balance of our world and habitat. In other words, all species ~~are~~ ^{are} playing a tremendous role in nature and ecosystem chain. Because, loss of any species can dramatically change natural balance of our world. Also, many human, sector, environment, economy, population and animal can easily affected from this change. We can

Illustrate this situation with "apex species". Apex species are said to have the most tremendous effect on nature and this effect is undeniable. Therefore, their extinction can result with unlimited awful situations. "According to Cho, pandemics, fires, decreased carbon sequestration and many other possible results can stem from extinction of apex species." (2019, pg. 2)

These various consequences can damage our lives over the normal circumstances unquestioningly. In brief, we can mention that there are several negative outcomes of apex species loss. Therefore, some major steps should be taken in order to prevent these crucial results and conservation of endangered species should be prioritized.

Second reason that why conservation of endangered species should be prioritized is connected with possible economic problems. Although many people are not aware, there is clear correlation between many species and economies. Endangered species are just not related with potential natural outcomes, they are also important for economy. There are many sector sector and production which depends on species' activities.

For instance, bees are the most important animals for producing honey which is a relevant food in every region. Moreover, pollinators are the back-bone of seed and fruit production. Also, these are just two examples of how some species are extremely important for economies and industries which depends production. According to Cho, a number of industries have already impacted by species loss (2019, pg.2). As a result, we can not reject that there is a strength connection between some industries and endangered species. In other words, impacts of species loss on economy can easily observed and we need some possible solutions to prevent extinction of species.

However, without the conscious of how every specie is important for overall life chain, some people argue that "we don't need all species to maintain our lifes." The species that we rely on for food and shelter are a tiny proportion of total biodiversity (Pyrn, 2017, pg. 2). Meanwhile, these arguments have don't the knowledge of how natural balance is remaining by the connection between all species. Every specie has affected the nature since the occurence of world;

And we can not reject the idea that this balanced system in nature is a result of the connection between all species. According to Cho, all species are connected through their interactions in a web of life." (2019, pg. 1) So, it is obvious that this natural chain between all species are the main factor that maintains natural process. Furthermore, the proportion of species that we need is less important than the chain between all species in the world. We need all of them to survive, protect our nature and create a stable future for future generations.

In conclusion, the issue of species loss which causing by human activities has bring many problems with them. Some economical problems and the derrangement of natural balance in our world are one of the most crucial negative results of this issue. This issue and it's effects should be observed with different perspectives and some possible solutions should be found. If people become more conscious toward this issue, we can mention that a better world is waiting us and we can conserve our nature for next generations.
