

In today's global world, "Should the conservation of endangered species be prioritized, or should extinction be accepted as a natural process of evolution?" is one of the most argued questions. People want to know if it's morally right to let endangered species go to extinction or should we save them? I personally believe that extinction should be accepted as a natural process of evolution. The topics that will be considered are "The history of extinction", "The Earth finds a way to reproduce" and "The human part of extinction".

Many species have gone extinct in the world history. As R. Alexander Pyren said "Mass extinctions periodically wipe out up to 95 percent of all species in one fell swoop" (1). No matter how or when a species lived, the only thing that will happen at the end is death, and extinction. R. Alexander Pyren said that "The inevitability of death is the only constant in life, and 99,9 percent of all species that have ever lived, as many as 60 billion, have already gone extinct" (2). As we see even before humanity existed, most of the species have gone extinct. This is the inevitable truth of the world. Humans shouldn't try to stop this natural process. If something is going to have an adverse effect on an ecosystem, it is the humans that trying to "save" the nature. We have to accept that animals do and will go extinct, and there is nothing to do for the species that have already gone extinct.

The extinction and death are a natural process in the world and evolution history.

Even today, many species are face to face with extinction. As Renée Cho said "According to the International Union for Conservation of Nature's Red List of Threatened Species, over 26,500 species are in danger of extinction." (1). This huge number may seem unfair for the endangered animals but we should remember that "Extinction is the engine of evolution, the mechanism by which natural selection prunes the poorly adapted and allows the hardiest to flourish" (Pyron, 1). The world is always changing and the species that can not keep up with it unfortunately go extinct. This extinction is not end of the world. As R. Alexander Pyron said "(...) both the planet and humanity can probably survive or even thrive in a world with fewer species. We don't depend on polar bears for our survival, and even if their eradication has a domino effect that eventually affect us, we will find a way to adapt." (2). The Earth and humanity can easily deal with the extinction of many species. Even if this means the death of thousands of animals, this is a natural thing and humanity should not try to block it.

Humans are a natural product of evolution. We are animals and have no control on the morality of

extinction. As R. Alexander Pyron said "(...) we are part of the biosphere just like every other creature, and our actions are just as volitional, their consequences just as natural." (1). We did not create this world. Therefore we can't decide whom to live and die. Humans may have some adverse effect on some species, but we should know that "(...) extinction does not carry moral significance, even when we have caused it. Unless we somehow destroy every living cell on Earth, the sixth extinction will be followed by a recovery, and later a seventh extinction, and so on." (Pyron, 1). Of course we should save the species and habitats that can easily be saved, but should not act like "god", and save the whole world. As we can't turn the world to its pre-human self, we should not try to change where it goes. Renée Cho said that "Post generations would regard what we see as natural today as terribly damaged, and what we see as damaged today, our children will view as natural." (2). I do not agree with the "damaged" part. I believe that the change should be accepted as a normal and natural process of the Earth's existence.

I argued the topics of "The history of extinction", "The Earth finds a way to reproduce" and "The human part of the extinction". We feel like the extinction of endangered species is a bad thing, and we should do something to stop it but we can not change the way

Earth goes. We should simply observe the situation best
as we can and let the world do what it knows
best.
